

Xponent Web Personalization

The background of the slide features a dark blue gradient with a diagonal light blue stripe. Several dandelion seeds are scattered across the frame, some in sharp focus and others blurred, creating a sense of movement. The text "Training Overview" is centered in a white, sans-serif font.

Training Overview

Xponent Web Personalization Outcomes

- ◀ Creating a web tracking listener
- ◀ How to enable web tracking in a web site
- ◀ How to process and store web events
- ◀ How to enable web personalization in a web site
- ◀ Creating a personalization web service
- ◀ Certification

Target Audiences

Primary

Journey Manager

Joanna, the Journey Manager

INTERESTED IN...

- Validate and challenge pre-defined notions of customer journey
- Design, measure and investigate use cases (or visions)
- ROI
- Impact on customer retention, acquisition, revenue

Configurer

Cory, the Configurer

INTERESTED IN...

- Identifying data sources
- Designing logic
- Solution architecting logic and rules
- Testing and deploying new orchestration journeys

Analyst

Alex, the Analyst

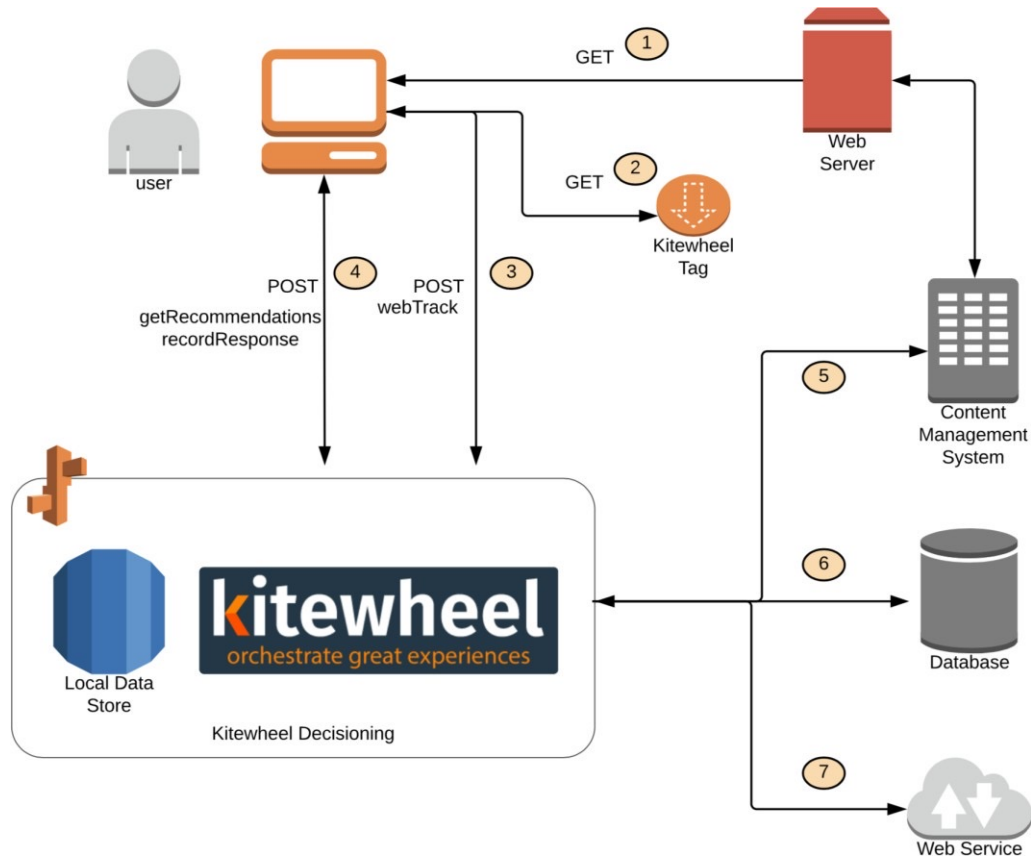

INTERESTED IN...

- Discover and investigate the Who, How, Why in order to:
 - Measure and increase effectiveness
 - Predict behavior
- Map journey performance against KPIs and benchmark

Web Personalization Introduction

Xponent Web Tracking and Personalization

Web Tracking and Personalization

◀ Web Tracking

- ◀ Web Tracking Listener on graph generates code to be inserted to web page
- ◀ Xponent tracking code delivered to browser
- ◀ Xponent tracking code creates a session and a persistent cookie
- ◀ Browser sends packets of information based on the JavaScript event model
- ◀ JSON packet is consumed by the graph
- ◀ Graph returns a valid response
- ◀ Every page that requires tracking needs the Xponent JavaScript
- ◀ Often use a tag manager to deploy the 'tags'

◀ Web Personalization

- ◀ If a personalization event is required with each tracking call then this can be done synchronously using the Web Personalization listener
- ◀ Otherwise use a API listener to return JSON to an XHR (XMLHttpRequest) or AJAX

Getting Started

Getting Started – In This Section

- ◀ Create a project
- ◀ Create a test web page
- ◀ Create a web listening graph
- ◀ Add the tracking JavaScript to the web page
- ◀ Event examples:
 - ◀ click
 - ◀ view
 - ◀ blur
 - ◀ formSubmit

Create Sample Listener

- ◀ Create a simple graph
- ◀ Create a web track schema element
- ◀ Add a Listener using the dropdown in the top left. Save output to schema
- ◀ Edit the sample HTML
- ◀ Add tracking code to <HEAD> section

▼ Web Tracking & Recommendation

Tracking Options

<input checked="" type="checkbox"/> Page Views	<input checked="" type="checkbox"/> Link Clicks <input type="checkbox"/> JQuery No Conflict	<input checked="" type="checkbox"/> Form Submits <input type="checkbox"/> JQuery No Conflict	<input checked="" type="checkbox"/> Dropdowns	<input checked="" type="checkbox"/> Button Clicks	<input checked="" type="checkbox"/> Input Blur
<input type="checkbox"/> DIV Clicks	<input type="checkbox"/> Geo Location	<input type="checkbox"/> Fingerprint			

Other Options

<input type="checkbox"/> Specify Cookie Domain	<input type="checkbox"/> Do Not Track
--	---------------------------------------

Copy the following snippet to add to your website's header

```
<script>  
var kw = {};
```

Getting Started – In This Section

- ◀ Add a `<DIV>` to the test page or the script provided
- ◀ Add a web recommendation success function
- ◀ Modify the JavaScript in the `<HEAD>` section
- ◀ Test random recommendations

Create Web Recommendation Action

- ◀ JavaScript success function – responsibility to alter the calling web page
- ◀ Use JavaScript/jQuery to unpack the message and update web page components
- ◀ Structure of 'data' object should agree with graph return node

Sample HTML DIV:

```
<div id="response"></div>
```

Sample Success Function:

```
_kw.success = function(data) {  
    // Handle returned data here  
    $('#response').empty().append(data.message);  
};
```

Web Tracking

Web Tracking – Overview

- ◀ Click tracking
- ◀ kwSession
- ◀ kwCookie
- ◀ kwFingerprint
- ◀ Tracking using other cookies
- ◀ Other tracking options

Web Tracking – Click Tracking

- ◀ Any page with the tracking API
- ◀ Page views
- ◀ Blur and form submits
- ◀ Button and link clicks
- ◀ DIV clicks
- ◀ Geo location

Web Tracking – kwSession

- ◀ Session cookie
- ◀ Erased when a user closes the browser
 - ◀ Could be maintained if certain settings are enabled
- ◀ Tracks the session of the user
- ◀ Does not track information about the user

Web Tracking – kwCookie

- ⏪ JavaScript created tracking cookie
- ⏪ Globally unique id with length of 37 characters
- ⏪ Used to link a specific device to a profile

Web Personalization

Web Personalization

- ◀ Create your own graph for web personalization
- ◀ Will determine the customization of the web page based on the profile of the user
- ◀ Use browsing habits to show them more appropriate content
 - ◀ If they have been looking at product A several times in the past month, show them pictures of product A on the homepage when they come to the site as oppose to the generic pictures
- ◀ The website will call for recommendations for certain parts
 - ◀ There should be a default value if there is not enough or no information on the user so the site never breaks

Web Personalization – `_kw.success`

- ◀ The `_kw.success` function will fire upon successful tracking of data from a webpage
- ◀ The endpoint will return a JSON object called 'data' with data inside of it
- ◀ This object can be used to return URLs or other pieces of information
- ◀ When the endpoint is called the database storing the profile information is read and logic is done to decide what to show the user (sent back as the data JSON object)

Web Personalization - Asynchronous and Synchronous

◀ Asynchronous

- ◀ Two different web tracking endpoints
- ◀ One to track the incoming things
- ◀ One to customize the webpage
- ◀ Works faster since they happen independently of each other and it can return the customized page faster because it doesn't need to first process the incoming web tracking data

◀ Synchronous

- ◀ One web tracking endpoint
- ◀ First does the logging and updating the database of the new page view or interaction
- ◀ Then returns the values to customize the webpage
- ◀ Is slower but has more up to date recommendations

Certification

Questions

- ⏪ How do I add web tracking to my web page?
- ⏪ Will it break my web site?
- ⏪ How do I add web personalization to my page?
- ⏪ What is the difference between asynchronous and synchronous recommendations?
- ⏪ How do I split up tracking and recommendations?
- ⏪ Where do I get the webtrack schema?
- ⏪ Do I need to set up queues?
- ⏪ What does the `_kw.success` function do?
- ⏪ Do I need jQuery on the page?
- ⏪ Does Xponent web tracking work with tag management systems?

Thank You
